

Solution Requirements

Date	14 August 2026
Team ID	XXXXXX
Project Name	XXXXXX
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	The system shall allow new users to create an account using name, email and password.	
2	Authorization levels	AdminMarketing ManagerSales ExecutiveBusiness Development UserMarketing Analyst	
3	External interfaces	The system shall allow users to enter product, target audience, campaign objectives, customer information and	

\marketing preferences.

4	Transactions processing	The system shall generate customized sales pitches based on product information, customer industry, business challenges and unique selling points.	
5	Reporting	The system shall generate potential customer objections and recommended responses for sales teams.	
6	Business rules, etc.	he system shall generate marketing strategies, optimization suggestions, recommended channels and next actions.	
7	Compliance to laws or regulations	The system shall display appropriate error messages when invalid input, AI failures or API communication problems occur.	
8	<i>Other</i>	The system shall analyze customer/lead information and provide relevant customer segments and insights.	

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria

1	Performance & Speed	The system should provide AI results efficiently and minimize unnecessary processing and API calls.	
2	Scalability	The architecture should allow additional AI features, users, data sources and cloud deployment to be added in the future.	
3	Security & Data Privacy	API keys and application secrets shall be stored securely using environment variables and shall not be hard-coded.	
4	Reliability & Availability	The application should handle API failures, invalid requests and database errors gracefully.	
5	Usability & Accessibility	The application should provide a simple, clear and user-friendly interface for marketing and sales users.	
6	Other Maintainability	The application should use a modular architecture separating routes, services, prompts, models, database and utilities.
